Module 1:
Understanding the Multiple Needs of Families Involved with the Child Welfare System

Child Welfare Training Toolkit

National Center on Substance Abuse and Child Welfare
Acknowledgment

A program of the Substance Abuse and Mental Health Services Administration (SAMHSA) and the Administration for Children and Families (ACF), Children’s Bureau

www.ncsacw.samhsa.gov | ncsacw@cffutures.org
Learning Objectives

After completing this training, child welfare workers will:

• Identify the prevalence of substance use and mental health disorders, and trauma in the child welfare population

• Recognize the effects of substance use, mental health, trauma, and co-occurring disorders on children and families

• Recognize the impact of bias and stigma from an agency perspective and a personal perspective

• Understand the importance of a family-centered approach when working with families with co-occurring challenges

• Identify the benefits of collaborating with other systems and service providers to better serve families
The Data
Prevalence of Parental Alcohol or Other Drug Use as a Contributing Factor for Reason for Removal by State, 2017

National Average: 37.7%

Note: Estimates based on all children in out-of-home care at some point during the fiscal year. (U.S. Department of Health and Human Services, 2018)
72% of states (N = 37) had an increased rate of children placed in OOHC from 2012 to 2017.

Note: Estimates based on children who entered out-of-home care during the fiscal year.

(U.S. Department of Health and Human Services, 2018)
Percentage of Children Under Age 1 Who Entered OOHC in the United States, 2000–2017

Note: Estimates based on **children who entered out-of-home care** during the fiscal year. (U.S. Department of Health and Human Services, 2018)
90% of states (N = 46) had an increased rate of children under age 1 placed in OOHC from 2012 to 2017.

Note: Estimates based on children who entered out-of-home care during the fiscal year.

(U.S. Department of Health and Human Services, 2018)
Identify the effect of substance use prevalence and drug death rates on child welfare caseloads, including:

- Total reports of child maltreatment
- Substantiated reports of child maltreatment
- Foster care entries

(Radel et al., 2018)
Comparison of Overdose Deaths and Foster Care Entries, 2002–2016

(Radel et al., 2018)
Child Welfare Laws and Considerations
When a child has been in foster care for 15 of 22 months, the state must request a petition to terminate parental rights, unless:

1. A relative is caring for the child,
2. There is a *compelling reason* that termination would not be in the best interests of the child,* or
3. The state has not provided the family the needed services within the required deadlines.

*For example, when the parent is participating and engaged in the substance use or mental health disorder treatment plan.*

(Child Welfare Information Gateway, 2017)
Child Welfare
12-month timetable for permanency hearing

Conflicting Timetables

Parent–Child Relationship
Attachment, loss, and separation

Treatment and Recovery
Ongoing process that may take longer
Indian Child Welfare Act Protection

Purpose:

• Protects the interests of American Indian families
• Addresses the process and considerations for removing Indian children from their families

The Indian Child Welfare Act protects unmarried Indian youth under 18 years of age who are:

• A member of a federally recognized Indian tribe, or
• The biological child of a member of an Indian tribe and eligible for membership in a tribe

(Bureau of Indian Affairs, 2016)
Indian Child Welfare Act Protection

The most common violations are:

• Failure to identify American Indian children
• Failure to inform the tribe once children are identified

To fully participate in these provisions:

• Make active efforts to contact the appropriate tribes
• Involve the tribes in decisions about the family
• Allow the tribe to take over the responsibility, if it wishes to do so

(Bureau of Indian Affairs, 2016)
Substance Use Disorders and the Effects of Prenatal Substance Exposure on Infants, Parents, and Families
American Academy of Pediatrics Technical Report
Comprehensive review of ~275 peer-reviewed articles over 40 years (1968–2006)

Effects of Prenatal Substance Exposure

Short-Term
Birth Anomalies
Fetal Growth
Neurobehavioral Effects
Withdrawal

Long-Term
Achievement
Behavior
Cognition
Growth
Language

(Behnke & Smith, 2013)
Interaction of various prenatal and environmental factors:

- Family characteristics
- Family trauma
- Prenatal care
- Exposure to multiple substances (alcohol and tobacco)
- Early childhood experiences in bonding with parents and caregivers
- Other health and psychosocial factors

(American College of Obstetricians and Gynecologists, 2017; Bandstra et al., 2010; Baldacchino et al., 2014; Nygaard et al., 2016)
Effect of Substance Use Disorders on Family Functioning

- Child development
- Household safety
- Psychosocial impact
- Parenting
- Intergenerational factors

(Smith & Wilson, 2016)
Substance Use Disorders, Mental Health Disorders, and Trauma in Child Welfare
Understanding Substance Use and Mental Health Disorders
Co-Occurring Disorders

Substance use disorder + Mental health disorder = Co-occurring disorders
Understanding Parents With Substance Use and Mental Health Disorders

• Self-medicate untreated emotional or health problems
• Manage untreated anxiety or depression
• Express anger and discouragement
• Punish themselves for failure
• Escape negative aspects of their lives

(Lander, Howsare, & Byrne, 2013)
Behavior Interventions

Lack of engagement

Refusal to comply

Lack of follow-through

Outreach

Warm hand-offs

Recovery support
Effects of Trauma

- Attachment and relationships
- Physical health: body and brain
- Emotional responses
- Dissociation
- Behavior
- Cognition: thinking and learning
- Self-concept and future orientation
- Economic impact

(National Child Traumatic Stress Network, n.d.)
Substance Use Disorder, Mental Health Disorders, and Trauma

- An estimated **10%–11%** of the **4.1 million live births** annually involve prenatal exposure to alcohol or drugs.
- Parents with substance use disorders often have a history of trauma, with **60%–90%** of treatment participants experiencing one or more traumatic events.
- Families affected by substance use disorders who are involved in the child welfare system need a system of care that recognizes the impact of trauma on their functioning and recovery.
- In a trauma-informed organization, every part of the organization—from management to service delivery—has an understanding of how trauma affects the life of an individual seeking services.
- Roughly **7.9 million adults** had co-occurring mental health and substance use disorders in 2014.
- Just over **42%** of persons seeking substance use disorder treatment have been diagnosed with co-occurring mental health and substance use disorders.

(Center for Substance Abuse Treatment, 2000; Dube et al., 2003; Felitti et al., 1998; Greeson et al., 2011; Kisiel et al., 2014)
Women’s Experiences of Co-Occurring Disorders, Trauma, and Domestic Violence

Childhood Abuse

- Women with substance use disorders are more likely to report a history of childhood abuse.
  - Physical, sexual, and/or emotional abuse

Trauma

- Many women with substance use disorders experienced physical or sexual victimization in childhood or in adulthood, and may suffer from PTSD.
- Alcohol or drug use may be a form of self-medication for people with PTSD and other mental health disorders.

(Substance Abuse and Mental Health Services Administration, 2009)
Women’s Experiences of Co-Occurring Disorders, Trauma, and Domestic Violence

Domestic Violence

• Women who have a substance use disorder are more likely to become victims of domestic violence.
  − Victims of domestic violence are more likely to become dependent on tranquilizers, sedatives, stimulants, and painkillers, and are more likely to abuse alcohol.

Co-Occurring Disorders

• Childhood abuse and neglect may contribute to anxiety, depression, PTSD, dissociative disorders, personality disorders, self-mutilation, and self-harming in adults.
• Among individuals with substance use problems, more women than men have a secondary diagnosis of a mental health disorder.

(Khoury et al., 2010; Substance Abuse and Mental Health Services Administration, 2009)
Additional Stressors

- Co-occurring substance use and mental health disorders
- Limited educational and vocational opportunities
- Limited fiscal resources
- Criminal involvement
- Physical illnesses
- Difficult and traumatic life experiences

(Center for Behavioral Health Statistics and Quality, 2015)
Stigma
Stigma associated with substance use disorder:

- “The Stigma of Addiction”: https://www.youtube.com/watch?v=LDsIGHEGj6w

Stigma associated with mental health disorder:

- “What Is Stigma?”: https://www.youtube.com/watch?v=9vkUMXaJDM4
Stigma

Two main factors affect the burden of stigma placed on a particular disease or disorder:

• Perceived control that a person has over the condition

• Perceived fault in acquiring the condition

(Education Development Center, 2017)
Stigma

• Affects the attitudes of...
  − Medical and healthcare professionals
  − Social service agencies and workers
  − Families and friends

• Creates barriers to treatment and impedes access to programs

• Influences policies

(Center for Substance Abuse Treatment, 2008)
Perceptions about people with substance use disorders:

- Once an addict, always an addict
- They don’t really want to change
- They lie
- They must love their drug more than their child
- They need to get to rock bottom, before…
Combating Stigma

• Are you using person-first language?

• Are you using technical language with a single, clear meaning instead of colloquialisms or words with inconsistent definitions?

• Are you conflating substance use and a substance use disorder?

• Are you using sensational or fear-based language?

• Are you unintentionally perpetuating drug-related moral panic?

(Center for Substance Abuse Treatment, 2008)
## Language Considerations

<table>
<thead>
<tr>
<th>Instead of:</th>
<th>Try:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addict</td>
<td>Person with a substance use disorder</td>
</tr>
<tr>
<td></td>
<td>Person with a serious substance use disorder</td>
</tr>
<tr>
<td>Addicted to X</td>
<td>Has an X use disorder</td>
</tr>
<tr>
<td></td>
<td>Has a serious X use disorder</td>
</tr>
<tr>
<td></td>
<td>Has a substance use disorder involving X (if more than one substance is involved)</td>
</tr>
<tr>
<td>Addiction</td>
<td>Substance use disorder</td>
</tr>
<tr>
<td></td>
<td>Serious substance use disorder</td>
</tr>
</tbody>
</table>

**Note:**
- “Addiction” is appropriate when quoting findings or research that used the term or if it appears in a proper name of an organization.
- “Addiction” is appropriate when speaking of the disease process that leads to someone developing a substance use disorder that includes compulsive use (for example, “the field of addiction medicine,” and “the science of addiction”).
- It is appropriate to refer to scheduled drugs as “addictive.”

(White House Office of National Drug Control Policy, 2015)
# Language Considerations

(White House Office of National Drug Control Policy, 2015)
Treatment
Substance use disorders are preventable and treatable.

Discoveries in the science of addiction have led to advances in substance use disorder treatment that help people stop misusing drugs and resume productive lives.

Treatment enables people to counteract addiction’s powerful disruptive effects on the brain circuitry and behavior and regain areas of life function.

Successful substance use disorder treatment is highly individualized and entails:

- Medication
- Behavioral interventions
- Peer support

“Groundbreaking discoveries about the brain have revolutionized our understanding of addiction, enabling us to respond effectively to the problem.”

—Dr. Nora Volkow, National Institute on Drug Abuse
Purpose of Treatment

• Reduce the major symptoms of the illness.
• Improve health and social functioning.
• Teach and motivate individuals to monitor their condition and manage threats of relapse.
• Substance use disorder treatment is classified into different modalities—detoxification, residential treatment, outpatient treatment, medication-assisted treatment, aftercare, and community supports.

(National Institute on Drug Abuse, 2018)

Assessment of Co-Occurring Disorders

Three possible paths:

1. One person does an assessment for both substance use and mental health disorder.

2. Assessment of substance use disorder leads to referral and assessment for a mental health disorder.

3. Assessment of mental health disorder leads to referral and assessment for a substance use disorder.

Not all treatment professionals are cross-trained to conduct both assessments, nor do they always actively look for co-occurring disorders.
Research-Based Approaches for Treating Women

Treatment Models

• Relationship-based; peer support, family support, and affinity groups
• Child care, transportation, economic support, and vocational/job services

Parenting Role

• Parenting role cannot be separated from treatment.
• Treatment programs that accommodate mothers with their children establish trust and engagement.

(Center for Substance Abuse Treatment, 2009; Werner et al., 2007)
Healthy Relationships for Fathers

• Fostering healthy relationships between fathers and children is integral to recovery from substance use and mental health disorders and development of parenting skills.

• Both parents should be involved in the lives of their children to the extent that children are safe and protected.

• The dependency court and child welfare systems are required to make reasonable efforts to locate absent fathers.

(Neger & Prinz, 2015)
A Family Focus

Parent Recovery
- Parenting skills and competencies
- Family connections and resources
- Parental mental health
- Medication management
- Parental substance use
- Domestic violence

Parental mental health
Medication management
Parental substance use
Domestic violence

Family Recovery and Well-Being
- Basic necessities
  - Employment
  - Housing
  - Child care
  - Transportation
  - Family counseling
  - Specialized parenting

Child Well-Being
- Well-being/behavior
- Development/health
- School readiness
- Trauma
- Mental health
- Adolescent substance abuse
- At-risk youth prevention

(Werner, Young, Dennis, & Amatetti, 2007)
Recovery Occurs in the Context of the Family

- A substance use disorder is a disease that affects the family.
- Adults (who have children) primarily identify themselves as parents.
- The parenting role and parent–child relationship cannot be separated from treatment.
- Adult recovery should have a parent–child component including substance use prevention for the child.

(Ghertner et al., 2018; Radel et al., 2018)
Recognizes that addiction is a brain disease that affects the entire family and that recovery and well-being occurs in the context of the family.

(Adams, 2016; Bruns et al., 2012)
Principles of Family-Centered Treatment

• Treatment is comprehensive and inclusive of substance use disorder treatment, clinical support services, and community supports for parents and their families.

• The caretaker defines “family,” and treatment identifies and responds to the effect of substance use disorders on every family member.

• Families are dynamic, and thus treatment must be dynamic.

• Conflict within families is resolvable, and treatment builds on family strengths to improve management, well-being, and functioning.

• Cross-system coordination is necessary to meet complex family needs.

(Werner et al., 2007)
Mothers who participated in the Celebrating Families! Program and received integrated case management showed significant improvements in recovery, including reduced mental health symptoms, reduction in risky behaviors, and longer program retention (Zweben et al., 2015).

Retention and completion of comprehensive substance use treatment have been found to be the strongest predictors of reunification with children for parents with substance use disorders (Green, Rockhill, & Furrer, 2007; Marsh, Smith, & Bruni, 2011).

Women who participated in programs that included a “high” level of family and children’s services were twice as likely to reunify with their children as those who participated in programs with a “low” level of these services (Grella, Hser, & Yang, 2006).

Benefits of Family-Centered Substance Use Disorder Treatment
Collaboration
Improving the outcomes of children and families affected by parental substance use requires a coordinated response that draws from the talents and resources of at least the following systems:

- Child welfare
- Substance use treatment
- Courts
- Health care
Substance use disorders can negatively affect a parent’s ability to provide a stable, nurturing home and environment. Of children in care, an estimated 61% of infants and 41% of older children have at least one parent who is using drugs or alcohol (Wulczyn, Ernst, & Fisher, 2011).

Families affected by parental substance use disorders have a lower likelihood of successful reunification with their children, and their children tend to stay in the foster care system longer than children of parents without substance use disorders (Brook & McDonald, 2009).

The lack of coordination and collaboration between child welfare agencies, community partners, and substance use disorder treatment providers undermines the effectiveness of agencies’ response to families (Radel et al., 2018).
Collaboration

Child welfare workers

+ 

Substance use professionals

+ 

Mental health professionals

Must collaborate to develop a case plan that is mutually supportive for their shared client
Benefits of Collaboration

• Contributes to better outcomes and efficiencies in the service delivery systems.

• The investment of time leads to better shared understanding, improved planning efficiency, and more effective monitoring of parental progress.

• Collaboration in case planning and information sharing can include child welfare workers, substance use treatment providers, mental health treatment providers, court professionals and other related service professionals.
Collaboration

- Collaboration can provide many benefits to families in treatment.
- Families experience benefits when child welfare workers understand the context of the parent’s substance use and/or mental health disorders and how treatment works.
- Collaboration promotes these benefits for families:
  - Improves family engagement
  - Improves planning and family outcomes
  - Reduces family stress
  - Helps families meet requirements
  - Improves information sharing

(Center for Substance Abuse Treatment, 2004)
Seven Collaborative Practice Strategies

1. **Identification:** A system of identifying families in need of substance use disorder treatment

2. **Timely Access:** Timely access to substance use disorder assessment and treatment services

3. **Recovery Support Services:** Increased management of recovery services and monitoring compliance with treatment

4. **Comprehensive Family Services:** Two-generation family-centered services that improve parent–child relationships

5. **Increased Judicial and Administrative Oversight:** More frequent contact with parents, with a family focus to interventions

6. **Cross-Systems Response:** Systematic response for participants based on contingency contracting methods

7. **Collaborative Structures:** Collaborative non-adversarial approach grounded in efficient communication across service systems and the courts
